### Dos and Don'ts of Client Authentication on the Web

Kevin Fu

#### UMass-Amherst Department of Computer Science www.cs.umass.edu

Based on USENIX Security 2001 paper by same name. Versions of this talk were given several times. History on: http://www.cs.umass.edu/~kevinfu/talks.html

#### What this talk is about

• Improving the security of client authentication on the Web

#### Where are we now?

• We have HTTP authentication

Connect to snafu.lc	s.mit.edu	? ×
	G	
Password Required		
User name:		•
Password:

	ОК	Cancel

#### Where are we now?

- We have HTTP authentication
- We've had SSL for nearly a decade

#### Where are we now?

- We have HTTP authentication
- We've had SSL for nearly a decade
- Client authentication should be easy, right?

#### Many Web sites get it wrong

Site	Security problem
WSJ.com	crypto misuse, secret key exposed
tiffany.com	SQL injection
opentable.com	guessable user IDs
cooking.com	guessable user IDs
SprintPCS.com	leaks authenticator in plaintext
FatBrain.com	predictable session ID
HighSchoolAlumni.com	circumvent password authentication
PerformanceBike.com	predictable session ID
ihateshopping.net	circumvent password authentication

#### **Toolkits are vulnerable too**

Toolkit	Security problem
BlueMartini	missing authentication check
Allaire ColdFusion	predictable session IDs, LCNG
ArsDigita ACS	signs ambiguous messages
Jakarta TomCat	predictable session IDs, random seed
PHP	session IDs based on time of day

#### How is it done?

# So how do Web sites implement user authentication?

#### **Cookies: what are they?**

- A Web server can store key/value pairs on a client
- The browser resends cookies in subsequent requests to the server
- Cookies can implement login sessions

#### Sample cookie

domain	.wsj.com
Path	/cgi
SSL?	FALSE
Expiration	941452067
Variable name	fastlogin
Value	bitdiddleMaRdw2J1h6Lfc

#### What adversaries do we fear?

#### Interrogative adversary

- Adaptively query a Web server a reasonable number of times
- Treat server as an oracle for an adaptive chosen message attack
- Extremely limited, but surprisingly powerful

#### **Types of breaks**

- Replay
- Existential forgery
- Selective forgery
- Total break

#### The cookie crumbles...

## Many Web sites that have invented their own homebrew cookie-based authentication schemes.

#### **Case studies of Web authentication**

- Lack of cryptography: HighSchoolAlumni.com
- Trusting user input: Instant Shop
- Leaking secrets: SprintPCS.com
- Predictable sequence numbers: FatBrain.com
- Missing authentication check: BlueMartini
- Misuse of cryptography: WSJ.com

#### Lack of cryptography

- Site: HighSchoolAlumni.com
- Problem: No cryptographic authentication
- Adversary: Interrogative
- Break: Universal forgery
- Today: Sold to another reunion site

### **Predictable sequence numbers**

- Site: FatBrain.com
- Problem: Customer can determine the authenticator for any other user
- Adversary: Interrogative
- Break: Selective forgery
- Today: Acquired by Barnes & Noble

## FatBrain response

"It's frustrating that programmers ... continue to fall prey to the same old tricks. Simple problems like lazy sequence numbers and buffer overflows in most cases can be easily eliminated if we as programmers would be a little vigilant about sound design and solid code reviews. I just \*love\* being at work on a Friday at midnight managing unscheduled production releases. :)"

## Missing authentication check

- Sites: saksfifthavenue.com, kohls.com, iomega.com, et al
- Problem: Customers can download order history of all users
- Adversary: Interrogative
- Break: Universal forgery
- Today: The sites have added the check

## BlueMartini: missing authentication check

https://www.saksfifthavenue.com/ POST /myaccount/order\_history\_new.jsp HTTP/1.0 Host: www.saksfifthavenue.com

bmForm=order\_history\_new& bmHidden=VIEW\_ORDER<>& VIEW\_ORDER<>orh\_id=12366456

# WSJ.com login process

- User enters name and password
- If the password is correct, WSJ.com issues a cookie
- User surfs to restricted content and attaches cookie
- If the cookie is authentic, WSJ.com returns content

## **WSJ.com** analysis

- Design: cookie = {user, MAC<sub>k</sub> (user)}
- Reality: cookie = user + UNIX-crypt (user + server secret)

# WSJ.com analysis cont.

username	crypt() Output	Authenticator cookie
bitdiddl	MaRdw2J1h6Lfc	bitdiddlMaRdw2J1h6Lfc
bitdiddle	MaRdw2J1h6Lfc	bitdiddleMaRdw2J1h6Lfc

- Usernames matching first 8 characters have same authenticator
- No expiration

## **Obtaining the server secret?**

- Adaptive chosen message attack
- Perl script queried WSJ with invalid cookies
- Runs in max 128 × 8 queries rather than intended 128<sup>8</sup> (1024 vs. 72057594037927936)
- 1 sec/query yields 17 minutes vs. **10**<sup>9</sup> years
- The key is "March20"

# Misuse of cryptography

- Site: WSJ.com
- Problem: Weaker than plaintext passwords
- Adversary: Interrogative
- Break: Universal forgery
- Today: The token got longer...

"... about the factors affecting design decisions, it is certainly result of time to market considerations. ... we simply didn't have clear security requirements defined within the group and outside the group. So, we did what worked. We tried a better encryption algorithm, but hit a bug that we couldn't fix, so we implemented one that worked even though the architect in charge was fully aware of its short-comings. You must understand that I'm giving you my read on the situation since I've joined WSJ.com just 5 weeks ago."

- Javeh Saleh, Vice President, Technology

Interactive Business Technology Services, WSJ.com

# Why cookies?

- SSL is computationally expensive
- No one outside enterprises uses SSL client certificates
- Browsers offer an inflexible GUI for HTTP authentication
- Popular browsers implement cookies

## HTTPS vs. HTTP handshake cost

# How did we break these schemes?

- Gathered public information
  - Observe usernames and Web server HTTP responses
  - Obtain sample authenticators
  - Create guest accounts
- Observe authenticators while varying parameters
- No eavesdropping

# Hints for client authentication

- Limit the lifetime of authenticators
- Make authenticators unforgeable
- Sign what you mean

# Limit the lifetime of authenticators

- Browsers cannot be trusted to expire cookies
- No revocation of WSJ cookies

# Make authenticators unforgeable

- Prevent modification of the cookie
- Do not allow bypass of password authentication
- Encryption alone does not prevent forgery
- HighSchoolAlumni.com

# Sign what you mean!

- badauth = sign (username + expiration, key)
  - **–** (Alice, 21-Apr-2003)
    - $\rightarrow$  sign (Alice21-Apr-2003, key)
  - (Alice2, 1-Apr-2003)
    - $\rightarrow$  sign (Alice21-Apr-2003, key)
- Same authenticator!
  "Alice" + "21-Apr-2003" ==
  "Alice2" + "1-Apr-2003"
- Use unambiguous representation or delimiters

# A scheme that mostly works

 $auth = capa + expire + MAC_k(capa + expire)$ 

where MAC could be HMAC-SHA1, capa could be an encrypted capability, expire represents an encrypted expiration, and '+' denotes concatenation with a delimiter

Secure against interrogative adversary

## A scheme that mostly works

 $auth = capa + expire + MAC_k(capa + expire)$ 

where MAC could be HMAC-SHA1, capa could be an encrypted capability, expire represents an encrypted expiration, and '+' denotes concatenation with a delimiter

Secure against interrogative adversary Still missing: A policy language for the capability

# The interrogative adversary defeats...

- SSL client authentication? No.
- HTTP Basic or Digest authentication? No.
- Homebrew cookie authentication schemes? Often...

# **Vulnerability disclosure**

- Vulnerability reporting is 1% technical analysis and 99% proper handling of disclosure.
- Report the bug to the vendor first. Then ask how long they need.
- There are release cycles and QA testing procedures. Be patient.
- Most companies are reasonable.
- If you are nice, you might get a free T-shirt. :-)

# Summary

- Many schemes broken easily by the interrogative adversary
- Hints could prevent vulnerabilities
- There is a simple scheme that works
- Cookies are limited; live with it or move on
